The Composition of Some Commercial Insecticides, Fungicides, Bactericides, Rodenticides and Weed Killers. A Compilation.

521
H. J. FISHER AND E. M. BAILEY.

Frequent requests for information as to the composition of commercial insecticides, fungicides and similar materials suggested the desirability of assembling the data on this subject to be found not only in various bulletins of this station but in those of institutions in other States where similar work is carried on. Designed at first for our own convenience, it was later felt that the information would be useful also to others interested. No pretense is made that the compilation is complete, but it is, at least, fairly comprehensive. For the most part the data were obtained from regular or special bulletins submitted by experiment stations or other state departments in response to our request for information on this subject. If any important sources of information are omitted it is because our requests were not referred to, or did not reach, the proper authorities.

In the case of insecticides which are definite compounds, sold under their own or well recognized names, such as arsenate of lead, Paris green, sulphur, etc., the publication of very old analyses did not seem to be warranted, and only those analyses reported from 1918 to the present are included in this index. In the case of products sold under proprietary names which do not make their composition readily evident, all analyses found are included however long ago they may have been published.

Only one analysis is given for each product except in those cases where different analyses have shown widely different composition. In such cases several analyses are included. An attempt was made to insert the latest analysis found in each case. When the latest publication found containing analyses of a certain insecticide or other product has given several analyses of that product, the figures in the index are usually averages.

It should be noted that the percentages given under "guaranteed" in the index represent maximum amounts in the case of water, inert matter and water-soluble arsenic, while the guaranties for other constituents are usually stated by the manufacturers as "not less than" the amount specified.

The index is arranged in alphabetical order by names of the products. Names beginning with arabic numerals are indexed as they would be if the numeral were spelled, - i.e., "20" is listed under "T". Certain common classes of insecticides are grouped together in tables alphabetically by the names of the manufacturers, but they are also cross-indexed by the names of the brands. An exception to this rule is made in the case of arsenate of calcium, arsenate of lead, Bordeaux mixture, lime-sulphur, London purple, Paris green and sulphur, which will not be found listed separately by the brand names, but only under the tables for these respective classes of insecticides.

Reference is made after each analysis to the source from which it was obtained. Some of the analyses are those made at this Station and not previously published. After such analyses the sample number and "Conn. Agr. Expt. Sta." is given in place of a publication reference.

No responsibility is assumed for the correctness of any analyses other than those made by this Station.

A

Ace-Hy.

(GENERAL CHEMICAL CO., NEW YORK, N. Y.)

Guaranteed: Inert matter (water), not more than 40 per cent.

Found: The preparation is an emulsion in which a cyanide, equivalent to 2.29 grams CN per 100 cc was the chief active ingredient detected. The ash, 3.58 per cent, consisted chiefly of iron and copper oxides. Water and volatile matter (at 100° C), made up 77.3 per cent of the material.—*Conn. Agr. Expt. Sta. Bull.* 242, 161 (1922).
